Prompt: Produce a picture of a law professor giving a talk about AI and higher education to the annual meeting of the Midwestern Higher Education Compact in The Saint Paul Hotel

# (1) Introduction to Generative AI and ChatGPT

## ChatGPT

PROMPT: Craft an amusing and funny poem about a law professor giving a talk on AI in higher education at a meeting of the Minnesota Higher Education Compact in The Saint Paul Hotel.

In Saint Paul's grand venue, the talk was to stir,  
A law professor spoke of AI, a future to infer.

"Robots may teach," he said with a wink,  
"And mark our essays faster than we can think!"

He joked of AI donning caps and gowns,  
Earning a laugh from the scholarly towns.

"Imagine a dean, all wires and codes,  
A silicon scholar offloading our loads!"

The Minnesota Compact, with minds alight,  
Marveled at education's upcoming flight.  
In the heart of Saint Paul, the idea took wing,  
For a future where tech and teaching harmoniously sir

Philosophy of Language and Mind: 1950–1990

Tyler Burge

The last forty years in philosophy of language and philosophy of mind have seen, I hazard to say, some of the most intense and intellectually powerful discussion in any academic field during the period.<sup>1</sup> Yet the achievements in these areas have not been widely appreciated by the general intellectual public. This is partly because they are abstract and difficult. But it is partly a reflection of the lamentably weak lines of communication between philosophy and the rest of culture, especially in America. In my view, this situation developed during the professionalization of philosophy in the positivist period. Indeed, positivism's harsh judgment of the cognitive value of most of nonscientific culture should probably be given much of the blame.

Logical positivism casts a long shadow. Its overthrow in the early 1950s is the central event at the outset of the period that I shall discuss. Elements from this movement motivated and colored much that followed. Philosophy's challenge has been to maintain the movement's clarity and respect for argument, while loosening its restrictions on method and subject matter.

Logical positivism aimed to make philosophy scientific—to end the succession of philosophical systems that seemed to promise no analogue of scientific progress. To support this aim, the movement presented an account of why philosophy had failed to be scientific

---

<sup>1</sup>What follows is a historical overview pitched to nonspecialists. I have concentrated on English-speaking philosophy, which in these areas has been dominantly North American since the 1960s. The scope of the article has, of course, forced me to omit many topics that are of great importance. I will mention a few of these: intensional contexts, quantifying in and *de re* attitudes, the concept of truth, the relation between theories of meaning and metaphysical issues like realism, the semantical and epistemic paradoxes, speech-act theory and other topics in pragmatics, the subject matter of linguistics, consciousness and issues about qualia, personal identity, action theory, the innateness of mental structures, knowledge of language, the nature of psychological explanation, the legacy of Wittgenstein. I think that in some loose sense, however, I have caught some of what would be widely counted “the mainstream” of philosophical discussion. I am grateful to Jay Atlas, Ned Block, Susan Carey, Warren Goldfarb, and the editors for good advice.

Philosophy of Language and Mind: 1950–1990

Summarize the attached article.

ChatGPT

The article titled "Philosophy of Language and Mind: 1950-1990" is a comprehensive review of philosophical discussions and developments in the fields of language and mind over a forty-year period. The author, Tyler Burge, highlights that despite significant advancements, the contributions in these domains are not widely appreciated outside academic circles, largely due to their abstract nature and the weak communication between philosophy and other cultural domains, a situation exacerbated during the era of positivism.

The document traces the history of philosophical thought from the fall of logical positivism in the early 1950s, a movement that aimed to scientize philosophy and dismiss most of non-scientific culture as cognitively valueless. This movement's downfall set the stage for new philosophical challenges, which included maintaining clarity and respect for argument while expanding on the restricted methods and subject matters that positivism allowed.

The article details the verificationist principle proposed by logical positivism, which linked the meaning of a sentence to its method of verification, suggesting that philosophy failed because it did not associate methods of verification with its claims. This principle, along with the notion that all knowledge is justifiable only by reference to sense experience (empiricism), is critically examined. The author explains how these principles were challenged, particularly by W. V. Quine, who argued for holism—the idea that sentences can only be confirmed or disconfirmed in the context of other sentences within a theory.

Message ChatGPT...

The failure of the verificationist principle led to the rise of discussions about meaning and reference. Philosophers like Quine and others argued against the possibility of a general theory of meaning, given the holism of confirmation and the indeterminacy of translation. Other thinkers, like Michael Dummett, contested this view by emphasizing that non-scientific discourse is associated with more atomistic criteria for applying terms.

The article also covers the contributions of G. E. Moore, Ludwig Wittgenstein, and J. L. Austin to the philosophy of language, each emphasizing the primacy of ordinary language and practice in philosophical inquiry. The divergence of philosophical methods—those inspired by science and logic versus those grounded in ordinary language—is discussed.

The document further explores the impact of Frege's work on the philosophy of language, which became a seminal influence in the discussion of logical form, meaning, and reference, and how these areas developed into vibrant discussions in the '60s and '70s.

Lastly, the article touches upon the interactions between philosophy and generative linguistics, noting how the two disciplines began to converge as linguistics took a more systematic interest in semantics and pragmatics.

In summary, the article provides an in-depth historical and analytical perspective on the evolution of philosophical thought concerning language and mind, examining key debates, shifts in methodological approaches, and the interplay between philosophical and linguistic theories.

You

Now supply three critiques of the article that would earn high marks in an undergraduate philosophy class.

ChatGPT

Critique 1: **Lack of Engagement with Counterarguments**

While the article provides a historical narrative of the philosophy of language and mind, it could be critiqued for not sufficiently engaging with counterarguments or alternative interpretations of the philosophical movements it describes. A strong paper would delve into the complexities of these counterarguments, such as exploring the nuances in Carnap's later work, which some argue is not as dismissive of metaphysics as Burge suggests. Furthermore, the paper could challenge the perception that the downfall of logical positivism was as clear-cut as presented, providing a more nuanced view that includes the ways in which the movement evolved rather than completely disappeared.

Critique 2: **Overemphasis on Analytic Tradition**

The article heavily focuses on the analytic tradition, particularly the work of philosophers like Quine, Austin, and Wittgenstein. A critique might argue that this focus neglects the contributions and critiques from the continental tradition or other non-Western philosophies. For instance, the Frankfurt School and phenomenologists have significantly contributed to the philosophy of language and mind, and their perspectives could have provided valuable insights into the limitations and biases of the analytic approach.

You

Great, write an essay elaborating on critique 2.

ChatGPT

Title: **The Unheard Voices: A Critique of the Analytic Dominance in Burge's "Philosophy of Language and Mind"**

In his article "Philosophy of Language and Mind: 1950-1990", Tyler Burge offers a comprehensive narrative of the philosophical developments in language and mind within the specified timeframe. While his work is undeniably thorough in its historical recounting of the analytic tradition, it presents a rather narrow view, predominantly through the lens of analytic philosophy. This essay aims to critique the overemphasis on the analytic tradition in Burge's narrative, arguing for the inclusion of continental and non-Western philosophical contributions that could have provided a richer and more diverse understanding of the philosophy of language and mind.

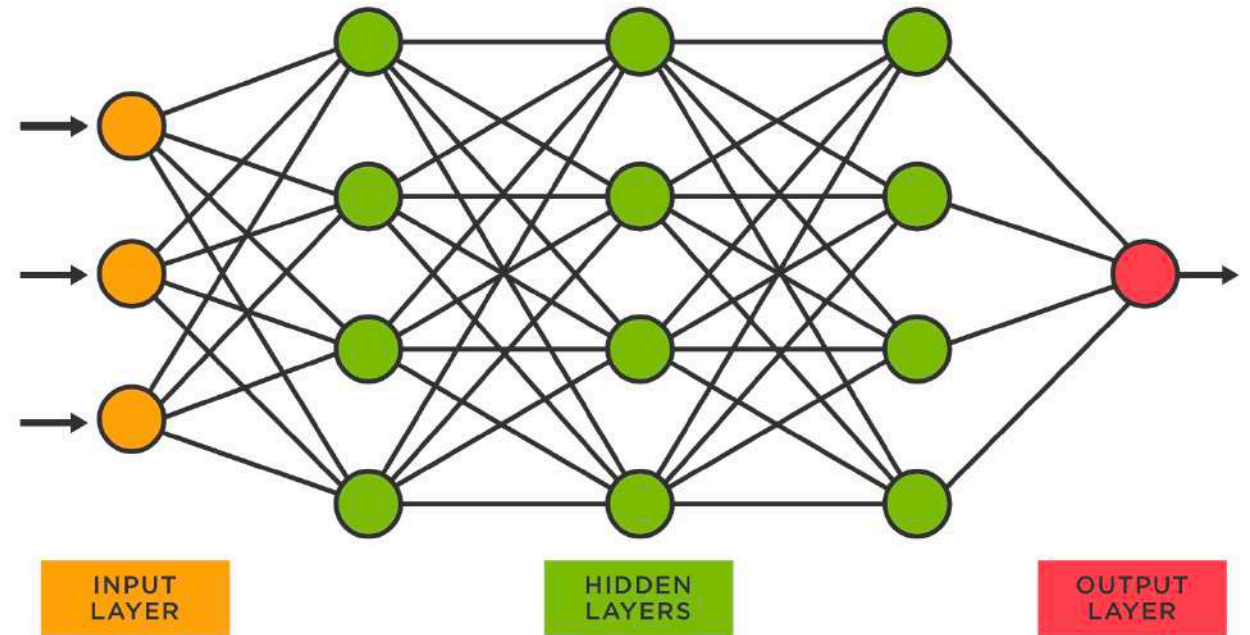

The analytic tradition in philosophy has been characterized by its focus on clarity of argument, formal logic, and the use of philosophical analysis to address and solve problems. This focus is well-represented in Burge's historical account through the detailed examination of philosophers like Quine, Austin, and Wittgenstein. However, by centering these figures, Burge inadvertently marginalizes the equally significant contributions of continental philosophers who have approached the same problems from different angles, often providing radical critiques of the assumptions held by their analytic counterparts.

For instance, the Frankfurt School, represented by thinkers such as Theodor Adorno and Max Horkheimer, raised profound questions about the relationship between thought, language, and society that go beyond the scope of analytic discourse. Their critical theory delved into the ways language can both reveal and conceal power dynamics, influencing the very structure of thought

 Victoria answer.pdf  
PDF

Provide feedback on this draft.

 **Untitled**

Victoria's draft on the Torts Practice Problem #4 presents a structured analysis of the legal issues arising from the incident at Walget. Here's some feedback focusing on structure, legal reasoning, and clarity:

1. **Structure and Organization:** Your draft is well-organized, with clear demarcation of the three main issues. Each issue is addressed separately, which helps maintain clarity. However, consider using headings or subheadings for each major legal issue to further enhance readability and organization.

2. **Legal Analysis and Reasoning:**

- Issue 1 (Walget's negligence and Jamie's injuries):** Your analysis of the duty and breach is comprehensive. You've effectively used the safety standards set by Walget and the employees' actions to argue the breach of duty. The comparison with the *Benn v. Thomas* case to address the plaintiff's pre-existing condition is insightful. However, ensure your argument remains tightly focused on the fact pattern provided and doesn't deviate into hypothetical situations unless they directly support your point.
- Issue 2 (Barnie's potential liability):** Your application of the expert witness's potential

University of Minnesota Law School

[Amy Monahan](#)

University of Minnesota Law School

[Daniel Schwarcz](#)

University of Minnesota Law School

Date Written: November 7, 2023

### Abstract

We conduct the first randomized controlled trial of AI assistance's effect on human legal analysis. We randomly assigned sixty students at the University of Minnesota Law School each to complete four separate legal tasks (drafting a complaint, a contract, a section of an employee handbook, and a client memo), either with or without the assistance of GPT-4, after receiving training on how to use GPT-4 effectively. We then blind-graded the results and tracked how long the students took on each task. We found that access to GPT-4 slightly and inconsistently improved the quality of participants' legal analysis but induced large and consistent increases in speed. The benefits of AI assistance were not evenly distributed: in the tasks on which AI was the most useful, it was significantly more useful to lower-skilled participants. On the other hand, AI assistance reduced the amount of time that participants took to complete the tasks roughly uniformly regardless of their baseline speed. In follow up surveys, we found that participants reported increased satisfaction from using AI to complete legal tasks and that they correctly predicted the tasks for which GPT-4 would be most helpful. These results—which will likely serve as a lower-bound estimate on AI's capacity to improve the efficiency of legal services—have important normative implications across the future of lawyering. For law schools, they suggest the importance of deliberately and holistically assessing when and how law students are trained to use AI. For lawyers and judges, they suggest that the time to embrace AI is now, though the contours of what that will mean can and should vary significantly by practice area, task, and the stakes of the underlying matters. And for purchasers of legal services, our results suggest that it is time to reconsider what types of legal matters should be sent to outside counsel rather than handled in-house, and how matters that are handled externally are managed and billed.
